Warranty

This Microphone or related part is warranted under the conditions outlined below to its original, registered owner, provided the purchase was made from an authorized Baltic Latvian Universal Electronics (BLUE) dealer. This Microphone or related part is guaranteed to remain free from operating defects for three years from the date of purchase. In the event that service is required, all necessary parts and labor will be furnished free of charge during this period except for tubes, which are guaranteed for 90 days against defects. This warranty is void if the serial number has been altered, removed or defaced. The warranty is void if the equipment is altered, misused, mishandled, maladjusted, or is serviced by any parties not authorized by Baltic Latvian Universal Electronics (BLUE). The warranty does not include transportation costs incurred because of the need for service unless arranged for in advance. Baltic Latvian Universal Electronics (BLUE) reserves the right to make changes in design and improve upon its products without obligation to install these improvements in any of its products previously manufactured. This warranty is in lieu of any or all expressed or implied.

In keeping with our policy of continued product improvement, Baltic Latvian Universal Electronics (BLUE) reserves the right to alter specifications without prior notice.

Congratulations on your purchase of the BLUE Mouse, a classic modern microphone made the old-fashioned way, without compromise. The unique rotating capsule (also utilized on the BLUE Dragonfly) makes this one of the most versatile and snazzy-looking mics you'll ever lay eyes on. And beneath the handsome exterior, you'll find that the Mouse is a precision recording tool, combining the low noise and superb transient response of top-grade modern electronics with the crisp, airy high end magic of legendary vintage vocal mics. In order to familiarize yourself with this microphone's specialized and unique features, please take the time to read this manual, and be sure to try the suggested recording tips.

The Mouse is a pressure-gradient cardioid condenser microphone, employing the BLUE single-membrane, factory-tuned large diaphragm capsule. For this hand-crafted diaphragm we have selected a 6-micron mylar film, sputtered with a mixture of pure gold and aluminum, and tensioned to our own hand-built brass backplates. Enclosed within a rotating spherical grille, the capsule can be positioned and adjusted in the smallest of spaces. This innovative design offers fine-tuning and precise placement to please the most discerning recordist, combined with an ease of use that is without equal among either vintage or contemporary microphones.

First and foremost, the Mouse has been designed to provide the commanding, intimate presence associated with the world's best (and most expensive) vintage vocal microphones. With its shimmering, detailed highs, smooth mid-range, and minimized proximity effect (a bass boost inherent in all unidirectional mics), this capsule design excels at delivering a vocal right to the front of the mix where it belongs. When processed with limiting and/or compression, as is standard practice for most pop vocals, tracks recorded with the Mouse will be free of pumping and low end thumps. Acoustic guitar, hand percussion, drums, and other critical high end sources also shine in front of the Mouse, gaining an extra measure of “air” and presence that enables the most delicate sounds to cut through a mix, even at very low levels.

The Mouse circuitry is based on a Class A, fully discrete circuit. In plain English, this means that the sound which arrives at the diaphragm is transduced (converted to electrical energy) as accurately as possible, with no integrated circuits (a.k.a. “IC’s”) in the signal path. To this end, the Mouse utilizes hand-selected electronic components of the highest quality (such as expensive metal-film resistors), and there are no pad or low-cut filter switches in the circuit.

The Mouse is available with two different output circuitries—transformer and transformerless. The main difference between these designs is that the transformer-based Mouse allows the user the option to run extra long mic cables for special applications and provides the user with the utmost protection for outside interference such as radio type frequencies (RF). These models are also designated by their difference in body color. The transformer version is styled in matte black while the transformerless is finished in a dark royal blue.

To get the most out of this, or any quality microphone, it is essential to pair it with a good microphone pre-amplifier. Most professional recordists prefer to have outboard preamps on hand, and will choose solid-state or vacuum tube models based on their unique characteristics. To maintain the integrity of your signal, use Blue's Quad high-definition mic cable going into the mic preamp. And, whenever possible, connect the

**Mouse Frequency & Polar Response**

This frequency chart of the Mouse capsule is only a start. It gives the recordist a basis of the sound provided. How the microphone reacts in a particular application will differ greatly because of many variables. Room acoustics, distance from sound source (proximity), tuning of the instrument and microphone cabling are only a few of the interacting issues. For an artist or engineer, how the microphones are used creates the basis of the sound.
mic preamp output directly to your recorder or A/D converter, bypassing the mixing board and any unnecessary components.

The single set screw at the top of the capsule should be left in place at all times, as it stops the grille from rotating 360 degrees. A recessed, threaded mic stand socket is built into the Mouse body, next to the XLR output jack. To put the Mouse on a stand, you may find it easiest to 1) loosen the boom stand arm or threaded end of the mic stand, 2) grasp the mic in one hand, and 3) screw the mic stand threads into the Mouse mount. This procedure will eliminate any possibility of handling damage to the mic.

The mouse comes with its own custom-built shockmount, The Shock, as an included accessory. Along with this external mounting, complete internal shockmounting is built into the Mouse at two stages; first by suspension of the capsule within the grille on three rubber stems, and then by shockmounting of the grille assembly where it contacts the U-shaped yoke. Blue’s optional handbuilt Pop Filter, The Pop, provides protection to the valuable microphone capsule and provide a means to minimize “P” popping sounds from voice work.

The Mouse requires 48 volt phantom power, which is standard with most mic preamps, mixing consoles, or separate phantom power supplies. It is important to note that some units, though rated at 48 volts, may supply insufficient or unstable phantom power, which can result in distortion and/or degraded performance when used with the Mouse.

To avoid damage to audio components when connecting phantom power, follow this simple procedure: 1) turn down the mic preamp gain, headphones, and your studio monitors, 2) connect microphone cable to the Mouse and microphone input jack, 3) turn on phantom power, 4) turn up the mic preamp gain, etc. To disconnect or re-route the Mouse, 1) turn down the mic preamp gain, headphones, and your studio monitors, 2) turn off phantom power and wait 10 seconds before disconnecting the mic.

Once the Mouse is on the stand and powered up, make sure that the active, on-axis side of the capsule (the shiny hemisphere of the grille) is facing the desired source. For example, if you are speaking into the mic, the Blue logo and shiny hemisphere will be in front of your mouth, and the solid metal ring around the circumference of the grille will be aligned vertically, with the single set screw in place on the top of the grille. The Mouse is a cardioid mic, and is designed to reject off-axis sound arriving at the back of the capsule (the dull metal hemisphere). And now, here are some recording tips that will allow you to get the most out of the Mouse and its elegant rotating capsule!

**Vocals**

Here’s a little-known secret — vocalists love singing into unique and impressive mics. And in addition to its good looks, the Mouse was developed especially to enhance the airiness and detail in any voice, while diminishing the proximity-induced lows which can cloud a mix or produce compression artifacts. Put it in front of any singer and you are guaranteed to get a 110% inspired performance that sits perfectly in the mix with little or no additional equalization. The Mouse is also an outstanding choice for narration and voiceover work.

For that “big” vocal sound with maximum presence, get the vocalist within one to three inches of the capsule. There is no need to worry about overloading the microphone capsule, but be sure to use the Mouse pop filter or a mesh windscreen to protect the diaphragm at this distance. Mount the Mouse on a boom stand, and tilt the capsule up (toward
the forehead) for more projection and head tone, straight on at
the mouth for maximum brightness and intelligibility, or down
toward the chest for more robust lows and smoother highs.

*Acoustic Guitar*

Large diaphragm mics require careful placement when used
on acoustic guitar, but the transparency and superb tran-
sient response of the Mouse are well-suited to this job. In
fact, reviewers have raved about the Mouse after trying it
on acoustic guitar, resonator guitar, and mandolin. For a
balanced sound with plenty of sparkling high end, position
the microphone facing the guitar neck, right where the neck
joins the body (usually around the 12th – 14th frets). For
starters, keep the mic as close as possible, and tilt the cap-
sule toward the soundhole to capture a blend of low end and
pick sound. If you need more lows, move the microphone
closer to the soundhole. For more high end detail, move the
Mouse farther from the guitar, either at the same neck posi-
tion, or above the instrument up by the guitarist’s head.

*Electric Guitar*

The Mouse is an excellent mic for any clean amp sound, rang-
ing from bright rhythm chords to warm jazzy tones. Rotate
the capsule toward the center of the speaker to capture more
highs, or turn the capsule toward the edge of the cone for
a fuller sound with more low end. For overdriven or dis-
torted tones, move the mic towards the outer edge of the
cone, or back it away from the amp a foot or more to add
a little room sound and soften the extreme high end.

*Drums*

The rotating capsule, superior sound pressure handling capa-
bility, and fast transient response of the Mouse offer numer-
ous advantages when recording drums. For kit and hand
drums, begin by placing the microphone two to four inches
above the rim or hoop (where the head is secured to the
shell). Angle the capsule toward the player’s stick or hand
to pick up more attack and definition. Turning the capsule
toward the shell will soften the sharp attack of a hand drum,
or pick up more of the bright, crackling buzz from a snare.
Moving the microphone closer to a drum generally increases
the low end, shell resonance, and separation from other
sound sources, while more distant placement emphasizes
the interaction of the drum and the environment, producing
a blended, airier sound.

*Percussion*

On tambourine, shaker, bells, clave, and orchestral percussion
the Mouse offers astounding clarity and realism. And unlike
most large diaphragm microphones, the Mouse can be posi-
tioned quite close to a percussive source without distortion
or undue proximity effect. Start by placing the microphone
about a foot from percussive instruments. Moving the mic
closer will emphasize detail and tone, as well as decreasing
the proportion of ambient room sound on a track. More
distant placement will yield a natural, roomy sound that
blends easily with other rhythm instruments.

Enjoy!
