

mini tube

Universal tube preamplifier for Oktava 100 Series capsules

Oktava “mini tube” is a new extension to the 100 Series microphones, which fits all available capsules of this series: MK-012, MK-101, MK-102, MK-103 and MK-104.

This remarkable microphone preamplifier combines the warmth and clarity associated with tube technology and the presence of the capsule design for which Oktava is famous. Selected Russian military 6C6Б-B tube combined with a special power-block design gives enough third-harmonic content to brighten and add warmth to any sound source.

The “mini tube” is for those who need one all round, multi purpose microphone, and suits digital recording perfectly by adding the character that can often be missing in digital recordings, while maintaining a very low noise floor. It is a very valuable addition to the microphone locker of larger studios having its own unique character which could be that elusive something extra during recording.

Freq. Response, Hz	20-20000
Full impedance, module, Ohm	200 ± 20
Minimum load impedance, Ohm	1000
Maximum SPL in 250-8000Hz range, dB	> 120
Free field sensitivity at 1 kHz, mV/Pa	> 10
Anode powering, V	80
Filament powering, V	5,8

MK-012 mini miniature preamplifier with extension cable

The new preamp is divided into two parts with an extension cable. In spite of a small size of the front part (it is smaller than a standard XLR plug) it contains all sensitive components. As a result, the quality of the audio signal is never compromised through the length of a cable.

Depending on your requirements the **MK-012 mini** can be supplied with cables of 1m, 2m or 5m length.
